Contents

Introduction	vii
Acknowledgements	ix
I Preliminaries	1
1 Survey of propositional logic	3
1.1 Introduction	3
1.2 The language	4
1.3 Two-valued semantics	6
1.4 The proof theory	7
1.5 Completeness	9
1.6 Exercises	11
2 The modal language	13
2.1 Introduction	13
2.2 The language defined	15
2.3 Some particular formulas	16
2.4 Substitution	17
2.5 Two remarks	19
2.6 Exercises	19
II Transition structures and semantics	23
3 Labelled transition structures	25
3.1 Introduction	25
3.2 Some examples	27
3.3 Modal algebras	28
3.4 Various correspondences	30
3.5 The diamond operation	32
3.6 The structure regained	34
3.7 Exercises	35

4	Valuation and satisfaction	39
4.1	Introduction	39
4.2	The basic satisfaction relation	41
4.3	Some examples	42
4.4	The three satisfaction relations	46
4.5	Semantics for modal algebras	48
4.6	Exercises	51
5	Correspondence theory	61
5.1	Introduction	61
5.2	Some examples	61
5.3	The confluence property	64
5.4	Some non-confluence properties	66
5.5	Exercises	69
6	The general confluence result	77
6.1	Introduction	77
6.2	The structural property	79
6.3	The set of formulas	82
6.4	The result	83
6.5	Exercises	84
III	Proof theory and completeness	89
7	Some consequence relations	91
7.1	Introduction	91
7.2	Semantic consequence	92
7.3	The problem	93
7.4	Exercises	94
8	Standard formal systems	97
8.1	Introduction	97
8.2	Formal systems defined	98
8.3	Some monomodal systems	102
8.4	Some polymodal systems	106
8.5	Soundness properties	108
8.6	Exercises	110
9	The general completeness result	119
9.1	Introduction	119
9.2	Statement of the result	120
9.3	Maximally consistent sets	121
9.4	The canonical structure	124
9.5	The canonical valuation	125

9.6	Proof of the result	126
9.7	Concluding remarks	126
9.8	Exercises	127
10	Kripke-completeness	129
10.1	Introduction	129
10.2	Some canonical systems	130
10.3	Confluence induced completeness	133
10.4	Exercises	137
IV	Model constructions	139
11	Bisimulations	141
11.1	Introduction	141
11.2	Zigzag morphisms	142
11.3	Bisimulations	144
11.4	The largest bisimulation	147
11.5	A hierarchy of matchings	148
11.6	An example	150
11.7	Stratified semantic equivalence	151
11.8	Exercises	154
12	Filtrations	157
12.1	Introduction	157
12.2	The canonical carrying set	159
12.3	The left-most filtration	160
12.4	The right-most filtration	161
12.5	Filtrations sandwiched	163
12.6	Separated structures	164
12.7	Exercises	166
13	The finite model property	169
13.1	Introduction	169
13.2	The fmp explained	169
13.3	The classic systems have the fmp	172
13.4	The basic temporal system has the fmp	180
13.5	Exercises	182
V	More advanced material	185
14	SLL logic	187
14.1	Introduction	187
14.2	The $*$ -closure of a relation	189

14.3 The axioms for SLL	189
14.4 SLL is not canonical	191
14.5 A filtration construction	193
14.6 The completeness result	197
14.7 Exercises	197
15 Löb logic	201
15.1 Introduction	201
15.2 The system defined	206
15.3 The rule of disjunction	206
15.4 The fmp	209
15.5 Exercises	214
16 Canonicity without the fmp	217
16.1 Introduction	217
16.2 The system defined	217
16.3 The characteristic properties	218
16.4 Canonicity	219
16.5 The finite models	220
16.6 A particular model	222
16.7 Exercises	222
17 Transition structures aren't enough	225
17.1 Introduction	225
17.2 The system KZ	226
17.3 The system KY	227
17.4 A particular structure	228
17.5 Exercises	232

VI Two appendices 235

A The what, why, where, . . . of modal logic 237

A.1 Introduction	237
A.2 Beginning	237
A.3 About this book	239
A.4 What next?	241
A.5 Some uses of modal logic	242

B Some solutions to the exercises 247

B.1 Chapter 1	247
B.2 Chapter 2	250
B.3 Chapter 3	252
B.4 Chapter 4	254
B.5 Chapter 5	260

B.6 Chapter 6	266
B.7 Chapter 7	267
B.8 Chapter 8	267
B.9 Chapter 9	278
B.10 Chapter 10	280
B.11 Chapter 11	286
B.12 Chapter 12	289
B.13 Chapter 13	293
B.14 Chapter 14	299
B.15 Chapter 15	304
B.16 Chapter 16	306
B.17 Chapter 17	308

Bibliography 311

Introduction

This book is an introduction to modal logic, more precisely, to classically based propositional modal logic. There are few books on this subject and even fewer books worth looking at. None of these give an acceptable mathematically correct account of the subject. This book is a first attempt to fill that gap.

Apart from its mathematical clarity, some other features of the book are:

- The central concept of the book is that of a labelled transition structure, and polymodal languages are used from the beginning.
- Modal languages are viewed as a tool for analysing the properties of transition structures, not the other way round.
- There is not an overemphasis on syntactic (proof theoretic) matters.
- Nevertheless, a detailed explanation is given of the differences between the weak completeness and Kripke completeness of formal systems.
- Correspondence properties (the expressibility properties of modal languages) are stressed as an important tool.
- Bisimulations are used as a method of comparing transition structures.
- Each chapter has a decent selection of exercises and over one sixth of the book consists of a comprehensive set of solutions to these exercises.

The book is aimed primarily at a computer science readership. However there is no computer science in the book and very little material which is directly attributable to a computer science motivation. Thus the reader of the book may be interested in modal logic in its own right or because of one or several of its applications in computer science. To read the book it is not necessary to understand any of these fields of application in any great depth.

The applications and uses of modal logic are many and varied. Aspects of the subject can be found in

- The analysis of tenses
- Concurrency
- Belief logic and default logic
- Program correctness
- Power domain constructions
- Situation theory

and several other areas. To emphasize some of these in preference to others would only restrict the possible readership. The aim of the book is simply to give a correct and concise account of the core of the subject with just a hint of the more advanced topics. The aim is not to describe the possible applications of the subject.

In order to keep the book to a reasonable size there are some important topics which the book does not attempt to cover. The book covers only propositional modal logic on a classical base. It does not consider any predicate logic versions of modal logic, nor does it consider any base logic other than classical 2-valued logic. The book does not give a detailed discussion of the various proof theoretic ramifications of modal logic. Only the simplest and most routine proof system is discussed. Nor is it concerned with the execution or implementation problems of model systems. Almost nothing is said about decision procedures for modal logic.

No doubt there are also other topics which you would have liked included, however these are for a more advanced or specialized book.

For convenience the book is divided into six reasonably sized parts. Each of these is devoted to one aspect of the subject as follows.

PART I, which covers Chapters 1 and 2, gives a survey of the required material concerning propositional logic and then introduces the family of (propositional) modal languages.

PART II, which covers Chapters 3, 4, 5, and 6, is concerned with various semantic matters. Chapter 3 introduces the structures which support the Kripke style semantics for modal languages, and Chapter 4 discusses these various semantics. The two Chapters 5 and 6 give various results which illustrate how properties of the supporting structures can be captured by modal formulas.

PART III, which covers Chapters 7, 8, 9, and 10, is concerned with proof theoretic matters. Firstly, in Chapter 7 various motivating semantic consequence relations are discussed. Then in Chapter 8, the standard proof theoretic machinery (as used in this book) is introduced and developed as far as is needed. Finally, in Chapters 9 and 10, two completeness results are proved. These show how the semantics and the proof theory interact in a nice way.

These three parts, I, II, and III, form (what should be) the basis of a first course in modal logic.

PART IV, which covers Chapters 11, 12, and 13, deals with more advanced, but still fairly basic, material. In particular, the notion of a bisimulation, the construction of models using filtrations, and the finite model property of certain formal systems are discussed.

PART V, which covers Chapters 14, 15, 16, and 17, gives four examples of more advanced, but interesting, topics. The first two examples (in Chapters 14 and 15) illustrate some of the power of modal logic, and the second two examples (in Chapters 16 and 17) illustrate some of the problems which come with this power.

PART VI consists of two Appendices. The first of these, Appendix A, contains both the first and last things you should read in the book. It is a general discussion of modal logic, from the various other introductory texts, what you can expect from this text, what you should read next, and a survey of some of the uses of modal logic. As soon as you finish this Introduction, i.e. at the end of the next sentence, you should go immediately to this Appendix. Finally, Appendix B is a fairly comprehensive set of solutions to the exercises given at the end of each chapter.

Acknowledgements

Frances Nex picked up several mistakes in early drafts of the book, and made many suggestions that improved the layout.

David Murphy kept me straight on some of the \LaTeX eccentricities.

Paul Taylor's customized package was used to produce the diagrams in this book.

However, anything between the covers that doesn't please you is entirely to my credit. The cover itself is the work of the C.U.P.

On a personal note I am grateful to Francis Lee, Joseph Holt, and Raquel who, at the time of writing, promise a better future, stand for traditional values, and live in a different world.
